

Windows 7 Touch 'Delivers' Oneview to The National Maternity Hospital, Dublin (Holles Street)

~ Access to Valuable Information, the Internet, Games, Music, TV, Videos and Telephone at your fingertips!

Dublin; January 21 2010: The National Maternity Hospital, (Holles Street) is the first Irish Hospital to upgrade their Oneview bedside patient educational and communication software to Microsoft's Windows 7 touch Technology. The Oneview system enables patients to have access to live TV, movies, internet, music, audio books and low cost phone calls delivered on Windows 7 touch screen. Everything you need for information and access to entertainment is simply at your fingertips.

Oneview is one of the first software companies within the healthcare market to adopt Microsoft Windows 7 Touch. The enhanced technology and touch screen will further enable hospitals to cater to individual patient needs, and deliver improved patient care and educational information.

Delivers the Best in Care While Reducing Cost

The Oneview System provides relevant information directly to expectant and new mothers at their bedside. This is beneficial to patients who wish to review, in their own time and in the privacy of their room, important information produced by midwives and other hospital staff on topics such as prenatal care and general care of a newborn baby.

"Oneview offers a useful information service through educational DVDs on pre and post care enhancing information provided by staff while in our care. Patients can afterwards refer to the DVDs as an additional support for postnatal advice when they are at home," commented Mary Brosnan, Director of Midwifery, Holles Street Hospital "Hospitals see the value and potential of this service in terms of delivery of better care by enabling patients to access important information in the privacy of their own bedside," added Ms. Brosnan.

Hospitals and their clinicians strive to deliver the best in patient care while finding innovative ways to reduce costs and increase efficiencies. Oneview specialises in the healthcare sector, providing the latest technology which is built on Microsoft Windows 7 Touch platform, with specific focus on clinical solutions, multi-lingual hospital communications, entertainment, and information. The 'on-demand' interactive educational videos are a unique and beneficial mechanism for educating patients in key health topics, influencing understanding and self management of their condition.

Creating a 'Home from Home' Experience

Being in Hospital doesn't mean you have to be out of touch. Patients and her visitors can also benefit from live TV, movies on demand, games, internet, music, audio books, internal and external phone calls, creating a 'home from home' experience.

"The exciting thing about the Oneview software being upgraded to incorporate Windows 7 Touch is that it provides an intuitive user experience in an environment where use of traditional input devices such as a mouse and keyboard would not be possible." commented Ronald Dockey, Client Business Manager, Microsoft Ireland.

One of the unique features about the Oneview system is the ability to customise how and what patients see on their screen. The Oneview Management software enables hospitals to adapt their screens and what patients can view.

Ronald Dockery explains, "The adaptability of the skin, or screen, along with access to programmes can be changed to suit specific patients giving more freedom and control to each individual user. For example, children and teens would have different requirements and interests to an elderly patient. Games and interactive learning tools for children can be added, levels of security and access granted, providing a safe method for patients to stay connected and to access information and services in a way that is easy to use with little or no training needed."

System Integration

Oneview's software can also incorporate integrated access to hospital information (IT) systems, such as patient records, meal ordering, billing, drug administration recording and other patient management services. The benefits are improved clinical and patient care, as well as reduced cost and risk.

Mark McCloskey, CEO Oneview comments: "Oneview has developed software technology, Oneview 360, which meets the increasing demand from healthcare providers for communication, education and entertainment solutions for patients and their families. We designed it to enhance the patient experience, whilst providing a platform for staff to access the hospital clinical and information systems. The system has been extended to include a web portal platform to allow hospitals address many patient and clinical needs prior to and after the hospital stay, ensuring a line to pre admittance care and post care follow through,"

"We are delighted that Oneview is now a global solution for hospital and patient care. We've had a fantastic response so far and will continue to work with hospitals to create integration functionality and systems which can help to significantly reduce healthcare costs, reduce risk, improve productivity, and improve medication management," added Mark McCloskey, CEO, Oneview.
